Steven Maynard-Moody Interim Director, Policy Research Institute

### Foreword

The Kansas Center for Community Economic Development (KCCED) is a joint center of the Policy Research Institute at the University of Kansas and the Kansas Center for Rural Initiatives at Kansas State University. Its purpose is to enhance economic development efforts by bringing university expertise to rural Kansas.

KCCED is funded by a grant from the Economic Development Administration of the U.S. Department of Commerce. The statements, findings, and conclusions of this report are those of the authors and do not necessarily reflect the views of the U.S. Government, the University of Kansas, or any other individual or organization.

### **Economic Trends Update: Atchison County**

### Introduction

The following report is an objective look at several key economic trends occurring in Atchison County over the last few decades. The Atchison County area is a community which has seen a slightly declining population in recent years, although the workforce has been growing. Specific data on those and other developments will hopefully prove valuable to Atchison County's community leaders.

This report looks at variables categorized under the following areas:

- population,
- employment,
- earnings and income,
- retail trade,
- agriculture, and
- education.

Throughout the report, Atchison County's performance is compared with the performance of the State of Kansas and other Comparative Counties.<sup>1</sup> It is by no means a comprehensive analysis of economic trends facing Atchison County but rather an overview of some key economic and demographic variables.

<sup>&</sup>lt;sup>1</sup> "Comparative counties" or "Selected counties" used for comparison in this report are Brown, Doniphan, Jackson, Jefferson, Leavenworth and Nemaha.

### POPULATION

In every community population size and economic activity are closely related. The size of population is directly related to employment opportunities within the area, wage differentials between regions, and a community's overall economic and social conditions. Growing communities are more likely to adapt successfully to a changing economic environment than areas with constant or decreasing population. New residents in a community mean additional consumers, taxpayers, and suppliers of labor. Without population growth, communities face problems of a tightening labor market, lack of new customers for businesses, a shrinking tax base, and an overall decline in economic activity. Generally, areas of population growth are also areas of economic growth, whereas areas of population loss suffered previous economic decline and restructuring.

Characteristics of the region's population are regarded as indicators of economic conditions and economic potential of this region. Past and projected population changes indicate economic trends in the community and can be compared to other counties, as well as the statewide and national averages.

Another characteristic of the economic potential of the region is migration of the population. Migration is linked to job opportunities and demand as well as wage differentials between regions. Counties with low rates of job creation and low wages will face higher worker mobility due to the lack of opportunity, or a "pull" phenomenon by urban areas with higher wages, better job opportunities, and a perceived better quality of life. Age and education also determine regional migration. Generally, the population aged 18 to 45 is the most mobile age group. The effect of education on migration is reflected by the movement of well-educated workers toward better job matches for themselves and their spouses and their attempts to raise their income levels by migrating to areas with employment opportunities.

The following section consists of population tables, figures, and maps, which together illustrate population totals, population growth rates, population by age groups, percent net migration, and population rankings.

### **Population: Key Findings**

- The population of Atchison County has declined every decade since the 1930's. Between 1980 and 1990 Atchison County's population decreased by 8 percent, while the growth rate of Kansas was a positive 4.8 percent and that of the U.S. a positive 9.8 percent. In the decade of the 1990's Atchison's population slip was arrested somewhat, with total losses at -0.8 percent. This was the smallest population drop of any decade since 1930, indicating the trend may possibly be on track to a reversal, though it is too early to tell. (Table 1 and 2, Figure 1b)
- Most of the comparative counties have experienced population growth during the last three decades, compared to Atchison's steady declines. All of the counties saw

decreased population growth in the 1980's, but only one county lost a higher percent of its population than Atchison: Doniphan, which lost 12.2 percent. In the 1990's only Atchison and Brown counties saw population declines. On the other hand, Jefferson county's population grew 16 percent, Jackson nearly 10 percent, and Leavenworth nearly 7 percent. (Table 2 and Figure 1a)

- The largest age group segment in Atchison County is made up of people in the 25 to 44 year-old range, but the percent of the population in that range is declining slowly over time. About 26 percent of the Atchison County population was in the 25 to 44 range in 1990, but only 24.5 percent was in that range in 2000. The age group which saw the most growth was the 45 to 64 year-old range, which grew from 18.8 percent of the population in 1990 to 21.4 percent in 2000. This data illustrates the effect of the aging baby-boom generation. (Table 3 and 3a and Figure 2)
- Census race data from 2000 can not be directly compared to data from previous years, due to a change in reporting which now allows people to select more than one race. In 2000, 266 people in Atchison County indicated they belonged to more than one race. Therefore, the 2000 Census data figures for individual races would probably be slightly higher if the old categorization had been used. Nevertheless, the new data is still useful for indicating trends. (Tables 4 and 4a)
- The population of Atchison County has become slightly more racially diverse over time, with the population in the 'Others' group growing the most over the last two decades. This group includes Asians, Pacific Islanders and Native Americans. This group totaled 118 people in 1980, compared to 246 in 2000, an increase of 108 percent. (Tables 4 and 4a)
- Though their numbers have been decreasing over time, non-Hispanic whites still
  made up the majority of the county's population in 2000, at 90 percent of the total.
  Blacks made up 5.3 percent of the population in 2000, Hispanics 1.9 percent, and
  Asians, Pacific Islanders and Native Americans made up 1.5 percent. (Tables 4 and
  4a)
- Each decade since the 1970s, Atchison County's net migration has been negative. Net migration is calculated as the change in population less the difference between births and deaths. A negative net migration indicates that more people have moved out of the county than have moved in. Between 1990 and 1999 Atchison County's net migration was slightly negative at -274 people, or about -1.6 percent of total population. That was the first decade when net migration was less than 1,000 people for Atchison. Net migration in Kansas from 1990 to 1999 was a positive 43,924. It is the first time since the 1970's that the state of Kansas had a positive net migration. (Table 5 and Map 3)
- Atchison County moved from being the 20<sup>th</sup> most populated county in Kansas in 1940 to being 29<sup>th</sup> in 1980, 30<sup>th</sup> in 1990, and 32<sup>nd</sup> in 2000. (Table 6)

In 1990 the ten-year population growth rate in Atchison County was 60<sup>th</sup> compared to all other counties in the state. In other words, 59 other counties had populations which grew faster than Atchison's from 1980 to 1990 (Map 1.) Between 1990 and 2000 Atchison's –0.8 percent growth rate was ranked 53<sup>rd</sup> in the state. (Map 2)

### EMPLOYMENT

Economic vitality of every community is reflected in the employment situation. This section compares the key employment measurements such as labor force size, job creation rate, and unemployment in the Atchison County area with its comparative counties and the state of Kansas.

The number of people who are either working or willing to work determines the size of the labor force. This number is influenced not only by the size of population but also by the perceptions of individuals that suitable job opportunities exist within the community. Diverse healthy economies tend to offer the widest variety of job opportunities and thereby attract a large number of job seekers, which increases the size of the labor force.

The unemployment level reflects the amount of economic activity within an area and how well the local market is able to match the supply and demand for labor.

Job creation rates (net change in average annual employment) reflect the growth in employment levels and the range of employment opportunities. As some jobs are lost in a community due to changing economic circumstances, they may be replaced by new jobs. Net job creation reflects the net gain or net loss in jobs over a given period of time.

Place of work data compared to the place of residence data provide the insight of the employment opportunities within the area.

The following data include tables, maps, and graphs on employment growth rates, number of firms by number of employees, percentage distribution of firms by number of employees, employment levels by industry, labor force participation, unemployment rates, and job growth.

### **Employment: Key Findings**

- Between 1990 and 2000 the average annual employment in Atchison County (U.S. Bureau of Economic Analysis data by place of work) increased from 7,652 employees in 1990 to 8,540 in 2000. Most of the growth occurred in the second half of the decade, with a 1.7 percent growth from 1990 to 1995 and a 9.8 percent growth from 1995 to 2000 (Table 7). During the second period, the average annual employment growth in Atchison County was even higher than the state growth rate of 6.3 percent. (Table 7 and Figure 3)
- In the first half of the decade Atchison County's employment growth was one of the most sluggish among the comparative counties. From 1990 to 1995 Atchison's employment grew at a rate of 4.1 percent, compared to rates over 8 percent for Doniphan, Jackson, Jefferson, and Nemaha. However in the second half of the

decade only Brown and Jackson county's employment growth rates exceeded Atchison's 9.8 percent. (Table 7, Figures 3 and 3a)

- The number of firms located in Atchison County increased 6.2 percent between 1988 and 1998, compared to a 12.6 percent increase for the state of Kansas over the same time period. (Table 8)
- The percentage distribution patterns of firms by the number of employees are nearly identical in Atchison County and the entire state of Kansas (Table 8a). The majority of firms are small companies with less than 20 employees. Between 1988 and 1998 their number decreased from 90.2 to 86.5 percent in Atchison County and from 88.4 percent to 86.5 percent in the entire state of Kansas. The percentage of the medium-sized companies with up to one hundred employees increased from around 7 percent to 11.2 percent in Atchison County. Both Atchison County and the state of Kansas have a small percentage of companies with more than one hundred employees, but their share in the total number of firms has decreased somewhat in Atchison (Tables 8 and 8a). This data indicates the importance of small businesses to the local economy.
- Total industry-level employment for Atchison County grew from 8,877 in 1993 to 9,662 in 1998, which represents a growth rate of 8.8 percent, compared with 13.5 percent growth rate for the state of Kansas during the same period of time (Table 9).
- From 1993 to 1998, farm employment decreased by 4.2 percent in Atchison County and fell by 1 percent in Kansas. The Government sector had the largest numerical decrease in Atchison County, losing 36 jobs from 1993 to 1998. However, as a percent of total Government employment the decrease was only 2.7 percent. The sector with the largest percentage decrease was Transportation, which lost nearly the same amount of jobs as Government (34 in this case) but the decrease was 16 percent of the total number of Transportation jobs. (Table 9)
- Major categories that saw increased employment between 1993 and 1998 included the Retail Trade sector which gained 348 jobs over the five year period, and the Services sector which gained 261 jobs. The sector which had the largest percentage increase was the Construction sector, which saw employment go up nearly 42 percent, from 335 jobs in 1993 to 475 in 1998. (Table 9 and Figure 4).
- In 1998, Services was the largest employment category in Atchison County with a 25 percent share of total employment. The second largest category was Retail Trade which employed 17.8 percent of all workers, followed by Manufacturing at 17.4 percent and then Government at 13.4 percent. All other sectors employed less than ten percent each of the total. The sector which saw its share of employment increase the most since 1993 was the Retail Trade sector. (Table 9a)
- Recent wage and salary employment estimates based on the place of work data show that employment of all industries in Atchison County increase 4.5 percent from

1998 to 1999. Employment estimates for the state of Kansas show a 1.3 percent increase from 1998 to 1999 (Table 9b).

- Place of residence data for Atchison County indicates a 4.3 percent annual increase in employment between 1998 and 1999 (these figures are from the Kansas Department of Human Resources, and as the name suggests, are based on the place of residence of individuals rather than their place of work). At the same time the civilian labor force increased by only 2.7 percent, leading to a 25.9 percent decrease in unemployment. (Table 8b).
- Comparing place of residence data and place of work data can indicate commuting trends. Table 9b shows that the number of jobs (place of work data) in Atchison County in 1999 was 1,575 less than the number of people employed in Atchison County in 1999 (place of residence data.) This could indicate that 1,575 people, or 18 percent of the number of employed people in Atchison County, commuted to a job outside of the county.
- The unemployment rate in Atchison County decreased from a rather high 5.4 percent in 1998 to a more reasonable 3.9 percent in 1999. The 1999 unemployment rate in Atchison County was about the average of those in the comparative counties. (Table 9b and Map 5)
- In the state of Kansas total employment (place of residence data) increased by 2 percent between 1998 and 1999. A much smaller increase in the civilian labor force resulted in a 20.4 percent decrease in the number of unemployed (Table 9b)
- The labor force participation rate is the percentage of population aged 16 and over that is in the labor force. The labor force participation rate in 1990 for Atchison County was 61.3 percent (Map 4). While relatively decent compared to other counties in Kansas, the rate was still somewhat lower than Kansas' rate of 65.4 percent and the U.S. rate of 64.4 percent (1990 U.S. Census.)

Map 5 County Unemployment Rates: 1999

*Note:* Employment data are based on an individual's place of residence.

Source: Policy Research Institute, The University of Kansas, "Kansas Statistical Abstract, 2000" using data from Kansas Labor Force Estimates Annual Average, 1999. Kansas Department of Human Resources, Labor Market Information Services, developed in cooperation with U.S. Bureau of Labor Statistics.

### **Earnings and Income**

The economic base of the community is determined by the income of the community's residents. Higher average wages may indicate a greater number of jobs in high growth, high performance businesses. Low wage growth may indicate a higher concentration of stable or declining industries.

This report looks at two major components of earnings and income: average wage per job and per capita personal income. Average wage per job reflects the productivity of local labor and the performance of local businesses. Per capita personal income indicates the relative wealth of the area compared to the state. As the productivity of business and industry increases, personal per capita income also rises.

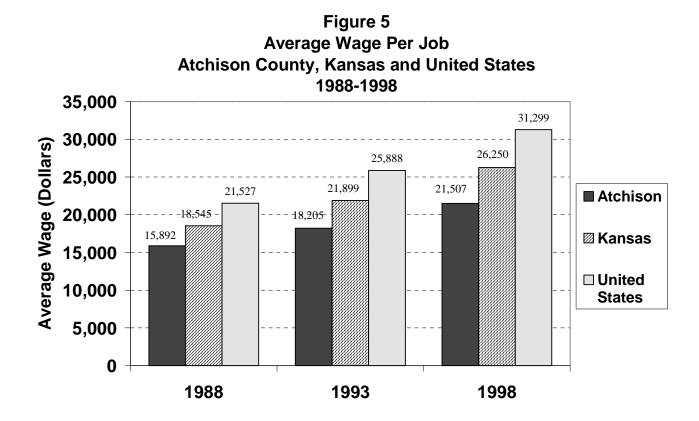

### Earnings and Income: Key Findings

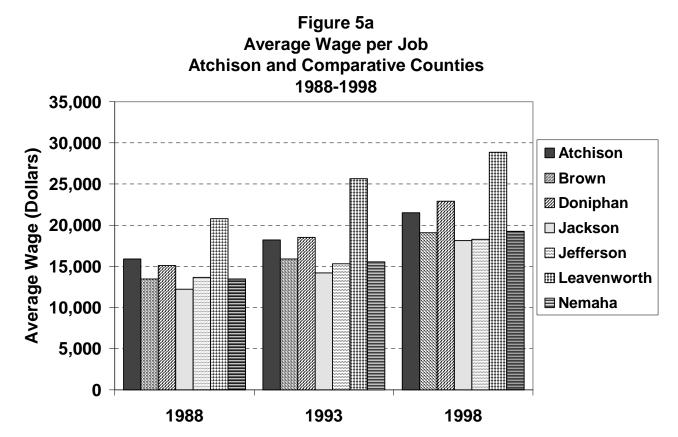

- In 1998 the average wage per job in Atchison County was \$21,507. That was \$4,743 less than the average wage for the state of Kansas and \$9,972 less than the national average (Table 10, Figure 5).
- Atchison's average wage per job compared slightly better to the selected counties in 1998. It was higher than the average wage per job in Brown, Jackson, Jefferson and Nemaha counties, but lower than the wages in Doniphan and Leavenworth counties. At \$28,852, the average wage per job in Leavenworth county was by far the highest, exceeding even the state average. This is likely due to the high number of Army officers in Leavenworth. (Table 10 and Figure 5a)
- In the five year period between 1988 and 1993 the average wage per job in Atchison County increased 14.6 percent and between 1993 and 1998 it increased 18.1 percent. These increases were for the most part less than those seen in the comparative counties, though not by much. The respective average wage increases for the state were 18.1 and 19.9 percent. (Table 10)
- Per capita personal income in Atchison County in 1999 grew slower than the state's rate, and at \$19,780 was still behind the state's average of \$26,705 per year (Table 11). Historical data show that not only has per capita income in Atchison County always been lower than the state average, but the gap between the two has been steadily widening over time. (Figure 5b)
- Per capita personal income for Atchison County was lower in 1999 than all of the comparative counties. Nemaha County had the highest per capita income at \$24,612. (Map 6)

### RETAIL

Retail trade is an important part of a community's business environment as well as source of revenues for the local governments. Retail trade is affected by a number of factors; for example, past decisions by investors, business managers, taxpayers, and policy makers contribute to a business climate which either promotes or inhibits the productivity of local businesses and therefore affects decisions about growth and expansion. Other contributing factors include the level of competition, the availability of suppliers and supporting industries, the cost of labor, and taxation and regulation within the community. Some types of establishments will thrive in an environment in which other firms cannot operate profitably.

The following section contains a table and a figure, outlining the retail sales growth rates.

### **Retail: Key Findings**

- Taxable retail sales in Atchison County stood at \$84.8 million dollars in 1999, the latest year for which data is available. For the most part retail sales grew during the decade, though the growth rates seem to have gone down in recent years. The growth rate from 1990 to 1999 for Atchison county was 19.6 percent, compared to 57 percent for the state. (Table 12)
- For most of the 1990's the taxable retail sales growth rates in Atchison County have been less than those seen statewide. Figure 6 illustrates this trend. (Table 12 and Figure 6)
- Atchison County's trade pull factor in 2000 was 0.55, which means it lost more retail activity to other counties than it was able to 'pull in'. All of the comparative counties had pull factors of less than one, meaning they too lost more retail trade than they gained. No doubt many residents of these counties travel to Johnson County or some Missouri counties to shop, making it difficult to retain much in the way of retail dollars. (Map 7)

### AGRICULTURE

While the economic well-being of Atchison County is not currently too dependent on the strength of this industry sector, it is interesting to look at the level of activity in agriculture and examine how the character of this industry is changing in the county.

The agriculture section contains two tables on the total value of field crops and the total value of livestock and poultry.

### Agriculture: Key Findings

- Nearly every comparative county as well as the state as a whole saw sharp declines in the value of field crops in 1997 and 1998. In Atchison County, after reaching a high of \$37 million in 1996, the value of field crops fell 18 percent in 1997 and another 17 percent in 1998, bringing the value down to \$25 million. That value was less than what it was for the county in 1995. The county with the highest valued crops in 1998 was Brown County at nearly \$55 million, followed by Nemaha County at almost \$50 million. (Table 13)
- The total value of livestock and poultry in Atchison County in 1998 was only \$11.5 million, a decrease of about 17 percent from 1995. During that time period only Doniphan County had a livestock value less than Atchison's. In 1998 Nemaha's livestock and poultry was valued at \$43.8 million, the highest of the comparative counties. (Table 14)

### EDUCATION

The educational level of residents is likely to influence the well being of the whole community. Communities able to provide a higher skilled workforce are more likely to benefit from new developing industries. Residents who have a good educational background will be more employable and able to command higher salaries. Employers will benefit as well because they will most likely experience lower turnover and training costs. On the other hand, individuals with lower education levels have a harder time finding jobs that can supply a living wage and may be more likely to use social services.

### **Education: Key Findings**

- Atchison County is the home of one institution of higher learning: Benedictine College. Even though it offers bachelor and graduate degrees, the percent of the population in Atchison county with either of those degrees is less than in the state as a whole. The difference is especially large for those holding bachelor's degrees. In 1990, the latest year for which data is available, a little over 14 percent of the Kansas population over the age of 25 held bachelor's degrees, compared to 7.3 percent in Atchison County. Six percent of the same population in Atchison held graduate degrees, and 4.5 percent held associate's degrees. (Table 15)
- In 1990, 68 percent of the over-25 population in Atchison County had no higher than a high school education, compared to 51.6 percent of the over-25 population in Kansas. (Table 15)
- Atchison County graduated roughly 150 high school students on average each year from 1990 to 1999. The number of high school drop-outs each of those years fluctuated from a low of 21 to a high of 78. (Table 16)
- High school drop-outs as a percent of graduates in Atchison County averaged about 26 percent a year from 1990 to 1998. The average rate for Kansas was 23.6 percent. However, the rate has been much more erratic in Atchison County than in the state. In 1996 Atchison's high school drop-outs were nearly 50 percent of the amount of graduates. The very next year that number was down to a very low 15 percent. (Table 16)

### CONCLUSION

Economic data is an important tool of the community economic development process because it gives community members a better view of the current facts and trends in different areas of economic and demographic performance of the community. However, numbers alone are not enough. The data must be analyzed and interpreted, taking into account the intuition of those within the community as to what the trends really mean. In other words, economic data serve as the foundation for analysis which concludes: 1) what is happening in the community relative to other regions over time, and 2) what potential impacts or consequences can be inferred from the data. A simplified look at the previous data would conclude the following:

Population in Atchison County has been declining since the 1930's. The good news is that in the decade of the 1990's the decrease was only 0.8 percent. While it is too early to tell, population levels in Atchison County may be close to stabilizing. Furthermore, during the same decade (1990's) the employment level in Atchison County rose nearly 12 percent, and the number of firms in the county has also been growing. Increased employment opportunities will certainly assist the county in retaining and attracting new residents, and the data encouragingly indicates that such may have been the trend in recent years.

The adult population of Atchison County is relatively less educated than the state average. While the latest data available is from 1990, at that time Atchison County's over-25 population had far fewer associate's, bachelor's or graduate's degrees than the state as a whole, percentage-wise. This may partly explain why the average wage per job in Atchison County is considerably lower than the state average and is about the same level as wages in rural counties. It is also consistent with the fact that the two largest sectors in the Atchison County economy are Services and Retail Trade, both of which offer rather modest wages. Increased educational opportunities are always a good thing to foster, but may or may not help alter these findings over time. Atchison County has Benedictine College, but it appears the majority of its students leave the county after graduation.

Atchison County no doubt faces some tough challenges in the years to come as it attempts to halt population losses. No easy answers to the problem can be given here, but again, the recent trends in employment and the slowing out-migration are positive indications that a change in direction is possible.
