Foreword

The Kansas Center for Community Economic Development (KCCED) is a joint center of the Policy Research Institute at the University of Kansas and the Kansas Center for Rural Initiatives at Kansas State University. Its purpose is to enhance economic development efforts by bringing university expertise to rural Kansas.

KCCED is funded by a grant from the Economic Development Administration of the U.S. Department of Commerce. The statements, findings, and conclusions of this report are those of the authors and do not necessarily reflect the views of the U.S. Government, the University of Kansas, or any other individual or organization.

Economic Trends Report: Lyon County

Introduction

The following report is an objective look at several key economic trends occurring in Lyon County over the last few decades. We look at variables categorized under the following areas:

- population,
- employment,
- earnings and income,
- retail trade,
- agriculture, and
- education.

Throughout the report, Lyon County's performance is compared with the performance of the state of Kansas and other Comparative Counties.¹ It is by no means a comprehensive analysis of economic trends facing Lyon County but rather an overview of some key economic and demographic variables.

¹ "Comparative counties" used for comparison in this report are Chase, Coffey, Greenwood, Morris, Osage, and Wabaunsee.

POPULATION

In every community population size and economic activity are closely related. The size of population is directly related to employment opportunities within the area, wage differentials between regions, and a community's overall economic and social conditions. Growing communities are more likely to adapt successfully to a changing economic environment than areas with constant or decreasing population. New residents in a community mean additional consumers, taxpayers, and suppliers of labor. Without population growth, communities face problems of a tightening labor market, lack of new customers for businesses, a shrinking tax base, and an overall decline in economic activity. Generally, areas of population growth are also areas of economic growth, whereas areas of population loss suffered previous economic decline and restructuring.

Characteristics of the region's population are regarded as indicators of economic conditions and economic potential. Past and projected population changes indicate economic trends in the community and can be compared to other counties, as well as the statewide and national averages.

Another characteristic of the economic potential of the region is migration of the population. Migration is linked to job opportunities and demand as well as wage differentials between regions. Counties with low rates of job creation and low wages will face higher worker mobility due to the lack of opportunity, or a "pull" phenomenon by urban areas with higher wages, better job opportunities, and a perceived better quality of life. Age and education also determine regional migration. Generally, the population aged 18 to 45 is the most mobile age group. The effect of education on migration is reflected by the movement of well-educated workers toward better job matches for themselves and their families and their attempts to raise their income levels by migrating to areas with employment opportunities.

The following section consists of population tables, figures, and maps, which together illustrate population totals, population growth rates, population by age groups, percent net migration, and population rankings.

Population: Key Findings

- Except for a small decline in the 1980's, the population of Lyon County has been increasing somewhat slowly since the end of WWII. The 2000 Decennial Census showed Lyon County's population to be at 35,560. (Table 1 and 2)
- Population in Lyon County grew 3.5 percent in the last decade, which ranked it in the middle of the comparative counties. Wabaunsee, Coffey and Osage counties grew more with decade rates of 4.3, 5.5, and 9.6 percent, respectively. Chase, Greenwood and Morris grew less, with the latter two actually experiencing population declines in the decade of the 1990's. (Table 2 and Figure 1a)

- The state of Kansas as a whole has seen steady population increases, with an 8.5 percent growth rate for the 1990's. The United State's population has also been growing rapidly. (Table 2 and Figure 1b)
- The largest age group segment in Lyon County in 2000 was made up of people in the 25 to 44 year-old range, though this amount was down slightly since 1990 (27.2 percent in 2000 compared to 30 in 1990). While 25 to 44 year olds may be the largest age segment, the only growing age segment was the 45-64 cohort, which added nearly two thousand members to its ranks in the decade of the 1990's. This indicates the effect of the aging baby-boomer population: Lyon County's population makeup is in general becoming older. The number of people in every other age group decreased or remained the same from 1990 to 2000. (Table 3a and 3b, Figure 2)
- Census race data from 2000 cannot be directly compared to data from previous years, due to a change in reporting which now allows people to select more than one race. In 2000, 775 people in Lyon County indicated they belonged to more than one race. Therefore, the 2000 Census data figures for individual races would probably be slightly higher if the old categorization had been used. Nevertheless, the new data is still useful for indicating trends. (Tables 4a and 4b)
- The population of Lyon County has become markedly more racially diverse over time. Although whites still make up the vast majority of the population (83 percent in 2000), the percentage of the total occupied by whites has been decreasing (compare to nearly 93 percent in 1980). All of the other racial groups have seen numerical increases in the last several decades. The Hispanic population has grown the most, from 4.4 percent of the population in 1980 to nearly 17 percent in 2000 (and the percentage would likely be higher had the old Census classifications been used in 2000). (Tables 4a and 4b)
- For the last two decades net-migration in Lyon County has decreased, even though in the last decade total population grew. Net migration is calculated as the change in population less the difference between births and deaths. A negative net migration indicates that more people have moved out of the county than have moved in, after factoring-in the effect of births and deaths. Between 1990 and 1999 Lyon County's net migration stood at -1,006, a figure indicating that 2.9 percent of the total 1990 population moved out of the county within the next ten years. The reason a negative net migration is possible during the same time period when total population rose is because the birth rate offset both the number of people who died and moved away. While negative net migration decreased significantly from the decade of the 1980's to that of the 1990's. The state of Kansas had a positive net migration of 1.8 percent over the last decade, the first time in four the state's rate was positive. In terms of ranking, Lyon County's net migration rate was 93rd out of 105 counties in the state from 1990 to 1999. (Table 5 and Map 3)

- Lyon County moved from being the 14th most populated county in Kansas in 1940 to being 15th in 2000. (Table 6)
- In 1990 the ten-year population growth rate in Lyon County was 33rd in the state, while in 2000 it was 37th. (Map 1 and 2)

EMPLOYMENT

Economic vitality of every community is reflected in the employment situation. This section compares the key employment measurements such as labor force size, job creation rate, and unemployment in the Lyon County area with its comparative counties and the state of Kansas.

The number of people who are either working or willing to work determines the size of the labor force. This number is influenced not only by the size of population but also by the perceptions of individuals that suitable job opportunities exist within the community. Diverse healthy economies tend to offer the widest variety of job opportunities and thereby attract a large number of job seekers, which increases the size of the labor force.

The unemployment level reflects the amount of economic activity within an area and how well the local market is able to match the supply and demand for labor.

Job creation rates (net change in average annual employment) reflect the growth in employment levels and the range of employment opportunities. As some jobs are lost in a community due to changing economic circumstances, they may be replaced by new jobs. Net job creation reflects the net gain or net loss in jobs over a given period of time.

Place of work data compared to the place of residence data provide insight into the employment opportunities within the area.

The following data include tables, maps, and graphs on employment growth rates, number of firms by number of employees, percentage distribution of firms by number of employees, employment levels by industry, labor force participation, unemployment rates, and job growth.

Employment: Key Findings

- Between 1991 and 2001 average annual employment in Lyon County increased from 17,817 employees to 18,256 in 2001. This was a 2.5 percent increase. (Table 7)
- Compared to the surrounding counties, Lyon's employment growth was much better than that seen in Chase, Coffey, and Greenwood counties. However, employment growth in Morris, Osage, and Wabaunsee counties was many times the rate in Lyon County. Employment in the state grew 8.9 percent from 1991 to 2001. (Table 7 and Figure 3)

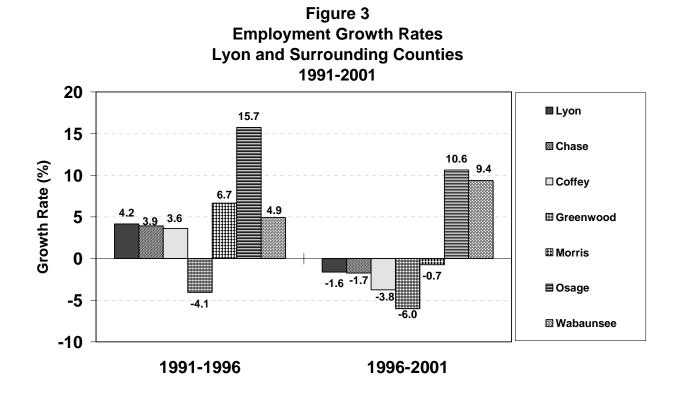

- The total number of firms located in Lyon County increased nearly 11 percent from 1989 to 1999, compared to a 13.4 percent increased for the state of Kansas over the same time period. This was a net gain of 89 firms for the county. (Table 8a)
- The patterns of distribution of firms by the number of employees are quite similar in Lyon County to the state as a whole. The vast majority of firms in Lyon County are small companies with less than 20 employees (86 percent in 1999). Between 1989 and 1999 their numbers rose by 65 firms, to 790 total in 1999. The percentage of medium-sized companies (up to one hundred employees) increased 19 percent (18 firms) in the same time period, while the number of companies with up to 500 employees increased 67 percent (6 firms). (Tables 8a and 8b).
- Total industry-level employment for Lyon County rose 2.7 percent from 1995 to 2000, a net increase of 628 jobs in five years. This is compared to a 10.5 percent growth rate for the state of Kansas during the same period. (Table 9a)
- Employment in the Transportation sector, though only accounting for about 6 percent of total employment, grew the most from 1995 to 2000 both percentagewise and in the actual number of new jobs added, 454 in all. That was an astounding increase of 51 percent. Retail Trade also grew considerably at close to 10 percent, an increase of 360 jobs. Finally, Manufacturing added 186 vital employment opportunities to the community from 1995 to 2000. (Tables 9a and 9b and Figures 4a and 4b)
- These employment gains were significantly offset by losses in other sectors, namely, the Services sector and Wholesale Trade. Services shed 204 positions in the five years from 1995 to 2000, Wholesale Trade 146 jobs, and Finance, Insurance and Real Estate lost 84 jobs. The loss in the Services sector is most troubling, since Services are vital to sustain a growing population. (Tables 9a and 9b and Figures 4a and 4b)
- Place of residence data for Lyon County showed the unemployment rate in 2000 to be 3.6 percent, a reasonable figure. This figure is from the Kansas Department of Human Resources, and as the name suggests, is based on the place of residence of individuals rather than their place of work. (Table 9c and Map 5)
- Comparing place of residence data and place of work data can sometimes indicate commuting trends. Table 9c shows that the number of jobs (place of work data) in Lyon County in 2000 was 1,250 less than the number of people employed in Lyon County (place of residence data). This could indicate that up to six percent of the number of people who live in Lyon county and are employed are actually employed in work outside the county. While Place of Work data does not include some types of businesses which Place of Residence data does, and therefore the actual number of commuters cannot be determined precisely from these numbers, the difference is great enough that in general it is reasonable to state more people commute out of Lyon County to work than commute in. (Table 9c)

- In the state of Kansas total employment (place of residence data) fell by 2.3 percent between 1999 and 2000. A smaller decrease in the civilian labor force resulted in a 21 percent increase in the number of unemployed statewide. (Table 9c)
- The labor force participation rate is the percentage of population aged 16 and over that is in the labor force. The labor force participation rate in 2000 for Lyon County was 70.4 percent. This rate was 14th in a list of 105 counties. The rate for Kansas was 68.5 percent. (Map 4)

Map 5 County Unemployment Rates: 2000

Note: Employment data are based on an individual's place of residence.

Source: Policy Research Institute, The University of Kansas, "Kansas Statistical Abstract, 2000" using data from Kansas Labor Force Estimates Annual Average, 2000. Kansas Department of Human Resources, Labor Market Information Services, developed in cooperation with U.S. Bureau of Labor Statistics.

Earnings and Income

The economic base of the community is determined by the income of the community's residents. Higher average wages may indicate a greater number of jobs in high growth, high performance businesses. Low wage growth may indicate a higher concentration of stable or declining industries.

This report looks at two major components of earnings and income: average wage per job and per capita personal income. Average wage per job reflects the productivity of local labor and the performance of local businesses. Per capita personal income indicates the relative wealth of the area compared to the state. As the productivity of business and industry increases, per capita personal income also rises.

Earnings and Income: Key Findings

- In 2000 the average wage per job in Lyon County was \$22,443. That was \$6,242 less than the average wage for the state of Kansas and \$12,209 less than the national average. (Table 10, Figure 5b)
- Lyon County's average wage per job compared quite well to the surrounding Kansas counties. Only Coffey County had a higher wage at 30,779, which bested even the state average. Average wage growth rates were also higher on average in Lyon County than the surrounding comparative counties. (Table 10, Figure 5a)
- Per capita personal income in Lyon County in 2000 grew slower than the state's rate, and at \$21,466 was \$5,908 behind the state's average of \$27,374 per year. Historical data show that in addition to always having a per capita income level lower than the state's, the gap between the two has widened considerably over time since 1980. (Table 11, Figure 6)
- In 2000 per capita personal income for Lyon County ranked 69th in a state with 105 counties. (Map 6)

RETAIL

Retail trade is an important part of a community's business environment as well as source of revenues for local governments. Retail trade is affected by a number of factors; for example, past decisions by investors, business managers, taxpayers, and policy makers contribute to a business climate which either promotes or inhibits the productivity of local businesses and therefore affects decisions about growth and expansion. Other contributing factors include the level of competition, the availability of suppliers and supporting industries, the cost of labor, and taxation and regulation within the community. Some types of establishments will thrive in an environment in which other firms cannot operate profitably.

Retail: Key Findings

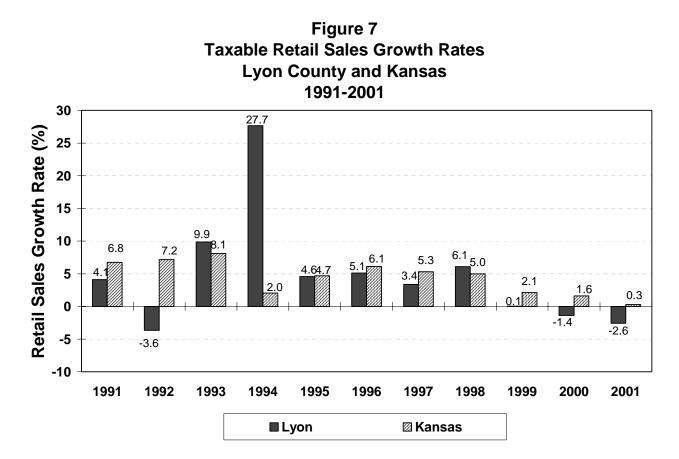

- Taxable retail sales figures for Lyon County and the state prior to 1994 are not comparable to numbers in 1994 and beyond, due to a change in source and method of calculation. This explains the unnaturally large jump in retail sales in Lyon County between 1993 and 1994.
- Taxable retail sales in Lyon County have grown slowly, but steadily, for the last decade, slowing only in recent years. This could well be a concomitant result of lowered Service sector employment. From 2000 to 2001 nominal taxable retail sales dropped 2.6 percent, the largest decrease since 1992. Growth for the decade (1991 to 2001) was nearly 57 percent, which compared favorably to 51 percent growth for the state as a whole. (Table 12, Figure 7)
- Lyon County's trade pull factor in 2001 was 0.91. A trade pull factor of less than one means the county lost more retail activity to other counties than it was able to 'pull in'. However, while less than one Lyon County's trade pull factor was still significantly higher than any of the surrounding counties. This indicates that people who do retail shopping outside of Lyon County are most likely travelling farther than adjacent counties, probably to larger metropolitan centers in Sedgwick or Kansas City/Topeka. (Map 7)

AGRICULTURE

The economic well-being of Lyon County has historically been tied to the agriculture/farming sectors. This section looks at the level of activity in agriculture and examines how the character of this industry is changing in the county.

The agriculture section contains two tables on the total value of field crops and the total value of livestock and poultry.

Agriculture: Key Findings

- Without exception, every county as well as the state of Kansas saw sharp declines in the value of field crops between 1996 and 1999. In Lyon County the steepest drop occurred from 1997 to 1998, in which time the total value of field crops decreased nearly 10 million dollars in one year. This was the trend for many of the other comparative counties as well as the state of Kansas. From 1996 to 1999, total value of field crops in Lyon County decreased 43 percent. Among the comparative counties, Only Coffey and Osage experienced worse declines. (Table 13)
- The total value of livestock and poultry in Lyon County also suffered a hit from 1997 to 1998, which it largely recouped the next year. In 1999 the total value was the highest in Lyon County that it had been in four years, and since 1996 total growth stood at 2 percent even considering a 12 percent drop in one year. Morris, Osage and Wabaunsee counties all experienced declining livestock values for the years in question, while Chase, Coffey and Greenwood counties, as well as the state overall, were fortunate enough to undergo strong positive growth. (Table 14)

	Total V	Value of C	rops (\$Mill	Percent Change

EDUCATION

The educational level of residents is likely to influence the well-being of the whole community. Communities able to provide a higher skilled workforce are more likely to benefit from new developing industries. Residents who have a good educational background will be more employable and able to command higher salaries. Employers will benefit as well because they will most likely experience lower turnover and training costs. On the other hand, individuals with lower education levels have a harder time finding jobs that can supply a living wage and may be more likely to use social services.

Education: Key Findings

- Given the presence of Emporia State University in Lyon County, it is somewhat incongruous that in 2000 the percentage of county residents possessing Associate's or Bachelor's degrees in the county was less than the same rate for Kansas. However, the number of Graduate level degree-holders was the same percentage as across the entirety of Kansas. (Table 15)
- The percentage of Lyon County residents over the age of 25 who had achieved less than a high-school diploma was about 18 percent, compared to only 14 percent for the state. (Table 15)
- Lyon County graduated roughly 354 high school students on average each year from 1990 to 2000. The number of high school dropouts each of those years fluctuated from a low of 56 to a high of 123, with the average being about 93. (Table 16)
- High school dropouts as a percent of graduates in Lyon County averaged about 27 percent a year from 1990 to 2000, slightly higher than the average rate for Kansas of about 23 percent. (Table 16)

CONCLUSION

Economic data is an important tool of the community economic development process because it gives community members a better view of the current facts and trends in different areas of economic and demographic performance of the community. However, numbers alone are not enough. The data must be analyzed and interpreted, taking into account the intuition of those within the community as to what the trends really mean.

Lyon County's population has grown consistently, albeit slowly, for many decades. This indicates a good foundation on which to build economic development efforts, and statistics show that growing Kansas counties tend to remain in that course for the long run. While the population in Lyon County is growing older, as it is across the state and nation, still new births in the last decade were great enough to offset a significant outmigration trend.

Educational achievement levels are somewhat lower in Lyon County than across the state; still, over a quarter of the above-25 population holds some sort of college degree. The primary employer in Lyon County is Manufacturing, which accounts for over 22 percent of all jobs. That is a very strong sign as manufacturing is often considered the backbone of solid economic growth, and not a majority of Kansas counties can claim to have it dominate their employment scene. Explosive growth in the Transportation sector, as it would be for any, is a positive outcome for the county, and should be built upon. Furthermore, deliberate and substantial progress in the total number of firms in the county over the last decade is an encouraging indicator of future potential. However, the sharp decrease in Service sector jobs in the county is troubling: services provide the necessary quality-of-life factors which not only attract new residents but retain existing ones. Additionally, a robust Service economy draws external dollars into the local economy, but as was seen in the case of retail sales these have been decreasing along with Service employment. In order for population growth to continue, new service jobs will need to be created.

The average wage per job in Lyon county was higher than all but one of its surrounding counties, probably due to the high proportion of manufacturing jobs. Higher-than-average wages are a strong incentive for new in-migrants to consider locating.

For comparable rural counties, it would seem that Lyon possesses a stronger than average economic base upon which to stage future economic development efforts.
